

A Company Brain your team can talk to.

Custom AI agents for your business — built on a graph architecture that maps how your people, systems, knowledge, and decisions actually connect. Not isolated chatbots. A connected intelligence layer. Built, deployed, and operated by us.

Why graph-powered agents work where generic AI breaks.

IT UNDERSTANDS

Relationships, not keywords.

The graph maps how people, teams, systems, documents, and workflows connect — so the agent reasons across your business, not across isolated snippets.

IT REMEMBERS

A persistent knowledge graph.

Your business in structured memory — every interaction, decision, and entity stays connected. Not a forgetful chat thread that resets every session.

IT ACTS

Give it an outcome, not a prompt.

It works across your tools, takes action on a schedule, and reports back when something matters. Grounded answers. Explainable decisions.

THE INTERACTIONS ARCHITECTURE

The Company Brain is built on a graph of how your business actually works.

Most AI tools retrieve isolated pieces of information. We model the relationships between everything that matters — and the agent reasons across them.

NODES

People, teams, clients, systems, documents, decisions.

EDGES

Who owns what, who decided when, what depends on what.

CONTEXT

Every interaction strengthens the graph and the agent's grounding.

OUTPUT

Grounded, explainable answers that get better the more it's used.

Fully managed. No AI Ops team required.

We handle the operational layer — graph, integrations, and agent behavior — so your Company Brain stays reliable as the underlying AI changes week to week.

- **Recovery**
Automatic failover & retry
- **Upgrades**
Models & tools, handled

- **Drift detection**
Catches regressions early

HOW TO START

Try it. Pilot it. Go managed.

01 • TRY

Demo

See a graph-powered agent run on a real workflow.

02 • PROVE

2-Week Pilot

Custom build on your stack, your data, your graph.

03 • SCALE

Managed Subscription

We own the operational layer end-to-end.
