

AI GOVERNANCE AS A SERVICE

Your teams already build with AI. Nobody is governing it.

Most of it is invisible: no owner, no review, no audit trail, no measurement. We give your company a complete operating model to govern every AI asset from creation to production. **One model. Every team. Full visibility.**

THE REAL RISK

It's not that your teams are building with AI. It's that they're building **without governance**, and that gap widens every week.

THE PRODUCT

Five pillars. One operating model.

Asset Catalog

A central registry of every AI asset: owner, purpose, systems touched, review status. Nothing reaches production without an entry.

Review Workflow

Draft, review, approval, and activation are separate stages. AI output never becomes production work by default.

Security Layer

Every system connection is declared and logged. Access is auditable and revocable. No self-provisioned credentials.

Training Portal

Employees see approved tools, complete required training, and follow guided templates before submitting for review.

KPI Dashboard

- Hours saved / week, by department
- Asset maturity score
- Run counts & failure rate
- Team adoption
- ROI by business unit

IN PRACTICE

What governance changes on the ground.

Code of Conduct

Created, versioned, and distributed. Every team member knows what AI use is permitted, encouraged, or prohibited.

Role Monitoring

Owners, reviewers, and approvers are assigned per asset. All activity is logged against a named role.

Permissions

Access is scoped by role. No blanket credentials. Permissions are explicit, auditable, and revocable at any time.

Allowed & Forbidden Actions

Clear guardrails for every AI tool. Boundaries are defined once and enforced across all teams.

Operations automations transfer cleanly when owners move on. HR-generated documents get a reviewer and a version history before they go anywhere. And when leadership asks what AI is doing, the dashboard has an answer: hours saved, adoption by team, and ROI.

WHY IT MATTERS

Reduce risk

No ungoverned assets reaching production without review or audit.

Accelerate adoption

Employees get a clear, trained path; governance enables speed.

Retain knowledge

Assets and access transfer cleanly when owners move on.

Create accountability

Every output has an owner, review history, and declared dependencies.

Measure impact

Per-asset baselines show what AI is actually doing for the business.

Scale with control

Every new AI tool follows the same governed review model.

Start with one pilot asset. Prove the model.

We pick one AI asset your team already wants to build or govern, and design the operating model around it.

- 1 Identify**
One real AI asset, with a measurable time-saved baseline.
- 2 Govern**
Catalog it, define its review path, and declare its connections.
- 3 Measure**
Track it live on the dashboard, then roll the model out.

Every connection declared. Every action logged.

Credentials are issued, never self-provisioned. Full audit trail per asset; when an owner leaves, access transfers or terminates. Never orphaned.
